EXECUTIVE SUMMARY

KERAMIDA Environmental, Inc. (KERAMIDA) completed the excavation, disposal and risk assessment of petroleum contaminated soil located in the Area A Stamping Plant Property of the Studebaker/Oliver Redevelopment Project at 601 West Broadway in South Bend, Indiana (Site). The soil excavation and removal was conducted from February 8 to 11, 2005 for the City of South Bend, Economic Development Department. The purpose of the Site activities was to remediate petroleum hydrocarbon (TPH) occurrence in the soil located on the east side of Building 93. Soil from 4 to 5 feet was removed in an attempt to reach TPH concentrations below the Indiana Department of Environmental Management (IDEM) Leaking Underground Storage Tank (LUST) Cleanup Goals. A total of 669.5 cubic yards of petroleum contaminated soil was removed from the Site and disposed.

Twenty-three confirmatory soil samples plus requisite quality assurance/quality control samples were collected from the excavation pit along the north, east and south walls and the bottom of the excavation. The samples were submitted for analysis of total petroleum hydrocarbon – diesel range organics (TPH-DRO) and TPH-extended range organics (TPH-ERO). Additional material was collected in separate containers at each sampling location for potential analysis of benzene, toluene, ethylbenzene, and xylene (BTEX) and the polynuclear aromatic hydrocarbons (PAHs). These samples for potential analysis were collected to be able to do a risk assessment at locations where TPH values exceeded the LUST Cleanup Goals.

All of the confirmation samples collected from the bottom of the Area A excavation met the closure level of 100 mg/kg for TPH. Six (6) of the eleven (11) wall samples had TPH concentrations exceeding the closure level. Subsequent analysis for the RISC TPH compounds of concern, namely BTEX and PAHs, met the RISC Default Commercial/ Industrial Closure Level for Subsurface Soil. As there is no threat of direct contact with the remaining soil, KERAMIDA believes no further remedial action is necessary at Area A to protect human health and the environment in a Commercial/Industrial land use setting.

1.0 INTRODUCTION

KERAMIDA Environmental, Inc. (KERAMIDA) completed the excavation, disposal and risk assessment of petroleum contaminated soil located in the Area A Stamping Plant Property of the Studebaker/Oliver Redevelopment Project at 601 West Broadway in South Bend, Indiana (Site) shown on Figure 1. The remediation of the soil was performed under the Petroleum Remediation Grant Incentive (PRGI) Program. Soil excavation and removal was conducted from February 8 to 11, 2005 for the City of South Bend, Economic Development Department. The purpose of the Site activities was to remediate petroleum hydrocarbon (TPH) occurrence in the soil on the east side of Building 93. Soil from 4 to 5 feet was removed in an attempt to reach TPH concentrations below the Indiana Department of Environmental Management (IDEM) Leaking Underground Storage Tank (LUST) Cleanup Goal of 100 mg/kg. A total of 669.5 cubic yards of petroleum contaminated soil was removed from the Site and disposed. This report documents the activities and findings of the excavation and disposal of petroleum-impacted soil and follow up confirmation sampling.

1.1 SITE DESCRIPTION

The former Studebaker Stamping Plant is located on approximately 39 acres of property in downtown South Bend. The Site has been a commercial/industrial facility since the 1870's when it was used as a lumber yard by Studebaker Corporation. In the 1920's, a major expansion of the Site occurred to perform the integrated production of automobiles. The part of the plant in the remediation area was utilized for metal stampings, painting, assembly and shipping. The Stamping Plant contains approximately 1.4 million square feet of industrial buildings.

The Site is part of a larger redevelopment area in downtown South Bend. The area has been designated a Brownfields Revitalization Zone. The area is essentially vacant. The Site lies within a Wellhead Protection Area.

1.2 CONTAMINANT OCCURRENCE

A Phase I Environmental Site Assessment was completed for the entire South Bend redevelopment area properties. From the findings of this Phase I, initial Phase II Environmental Site Assessments were completed for properties within this larger area, including the Site. During this additional investigation, semi-volatile organic compounds (SVOCs), volatile organic compounds (VOCs), lead and other metals were found in soil and groundwater at numerous sampling locations throughout the Redevelopment Area in addition to the petroleum hydrocarbon contamination addressed in this report.

The remediation area defined in the Hull and Associates *Additional Phase II Environmental Site Assessment Activities Former South Bend Stamping Property* report consisted of a rectangular area approximately 90 feet north-south and 35 feet east-west on the east side of Building 93. The area is concrete paved and formerly was a rail spur for railroad car movement. The boundaries and depth of the remediation area were approximated on the basis of results of previous investigations conducted by Hull and Associates as noted above.

2.0 CLEANUP CRITERIA

The cleanup objectives for on-Site petroleum hydrocarbon contamination in soil are the IDEM LUST Cleanup Goal of 100 mg/kg TPH. At sample locations where the 100 mg/kg Cleanup Goal cannot be achieved, comparison of analytical results for Compounds of Concern (COCs) in a hydrocarbon release (BTEX and PAHs) are to be compared to the RISC Default Industrial Closure Levels that provide a representation of the level of environmental impairment relative to the planned non-residential land use for the Site. RISC is an agency-wide, non-rule policy for investigating and obtaining regulatory closure for sites using risk-based cleanup objectives. RISC Default Closure Levels have been developed for residential and industrial land use scenarios.

3.0 SCOPE OF WORK

The estimated volume of soil to be removed during the project was 500 cubic yards. The area planned for excavation was determined on the basis of previous investigations. Beginning in the area of soil boring SB-29, impacted soils were to be excavated down to a depth of five feet below ground surface (bgs) and laterally, until field observations indicated the end of impacted soils or

until the maximum amount (500 cubic yards) of soil was excavated. The location of SB-29 was to be identified in the field based on the Hull & Associates, Inc. Soil Boring Location Map.

Prior to backfilling, confirmation soil samples were to be collected from the bottom and walls of the excavation. The samples will be collected at a rate of one sample per 20 linear feet of wall and one per 400 square feet of bottom. The samples will be analyzed for Site-specific petroleum hydrocarbon chemicals of concern (COC) including TPH-DRO; TPH-extended range organics (TPH-ERO); benzene, toluene, ethylbenzene, and xylene (BTEX); and polynuclear aromatic hydrocarbons (PAHs). Data quality is to meet the LUST Minimum data Quality Objectives (DQO) established for closure and RISC assessment activities.

4.0 EXCAVATION ACTIVITIES

KERAMIDA supervised the removal and disposal of petroleum-impacted soil and collected confirmatory soil samples from the excavation at the Site between February 8 and 11, 2005. The soil removal and disposal activities were performed by Hoosier Equipment Service, Inc. of Indianapolis, Indiana, under the direct supervision of Mr. Rob Hoverman, Project Scientist with KERAMIDA. Prior to the initiation of the field activities, KERAMIDA notified the Indiana Underground Plant Protection Service (IUPPS) to mark the underground utilities at the Site. A Site safety meeting was performed at the beginning of field activities.

The concrete overlying Area A was broken up by the excavator and stockpiled to the side of the remediation area. Excavation of petroleum impacted soil commenced near the center of Area A at boring SB-29 as indicated on the reprint of a Hull & Associates, Inc. figure presented as Figure 2. The impacted soil was stained dark gray to black and the contact with the underlying yellowish brown sand was sharp. Excavation of impacted soil expanded to the north, south, east and west of this initial excavation location.

KERAMIDA and the on-Site City of South Bend representative determined through field observations that the impacted soil extended a considerable distance south of the anticipated area of impact. The excavation also advanced west and abutted up to the foundation of Building 93. A total of 903.8 tons (669.5 cubic yards) of petroleum-impacted soil was removed from the ground using an excavator and transported off-Site to Prairie View RDF located in St. Joseph

County, Indiana. The completed excavation was 120 feet in the north-south direction and ranged from 15 to 36 feet in the east-west direction. The depth was between four (4) and five (5) feet below grade. Photographs of the excavation "in progress" are presented in Attachment 1. At the conclusion of excavation activities, some discolored soil was still present in the walls of the excavation. The discolored soil occurred as a discontinuous black seam between one (1) and three (3) feet below the surface. Following soil removal and confirmatory sampling activities, the excavation was brought to grade by backfilling with clean sand and gravel. Soil disposal documentation is provided in Attachment 2.

5.0 CONFIRMATORY SOIL SAMPLING

A total of eleven confirmatory soil samples were collected from the north, east and south excavation walls and twelve (12) from the bottom of the excavation. Three (3) duplicate soil samples were collected for QA/QC purposes. Confirmatory soil samples were not collected from the west wall of the excavation as the excavation terminated against the foundation of Building 93.

The discolored soil produced no organic vapor response above background. As a result, confirmation samples were collected from the walls of the excavation based on the presence of discoloration. As noted above, the discolored soil was present as a discontinuous seam between one and three feet below grade. Where the seam was not present at a wall sampling location, the confirmation sample was collected from the same depth as the nearest discolored interval.

The confirmation samples were collected directly from the exposed wall face or excavation bottom by Mr. Hoverman using hands gloved with disposable nitrile gloves. New gloves were used for each individual sample collected. Confirmation soil sampling procedures followed the IDEM *Underground Storage Tank Guidance Manual* (November 1995). Samples were collected at twenty (20) foot intervals from the walls and from each twenty by twenty foot area of the excavation bottom. Samples were submitted to Heritage Environmental Services, LLC Commercial Laboratory Operations (HES CLO) for analysis of TPH-DRO, TPH-ERO and BTEX and PAHs where the 100 mg/kg TPH Cleanup Goal was not achieved.

Sample S-8 was collected from the north wall of the excavation. Based on field evaluation, the north end of the excavation was extended further north, the wall materials at the S-8 location being removed and disposed. As a result, sample S-8 was not submitted for analysis so there are no S-8 analytical results in Tables 1 and 2.

5.1 TPH CONFIRMATORY SOIL SAMPLING RESULTS

Closure confirmation soil sampling for TPH adhered to the IDEM's *Underground Storage Tank (UST) Guidance Manual* (November 1995). The results were compared to the IDEM LUST Cleanup Goals for TPH. Sample preparation for the DRO analysis was the DRO Accelerated Solvent Extraction by SW846-3545, with analysis by SW846-8015B (DRO by GC/FID) and ERO was analyzed by SW846-8015B (ERO by GC/FID).

Soil analytical results for TPH (DRO and ERO) are summarized in Table 1. LUST Cleanup Goals for TPH are provided at the right side of the table for comparison with the detected concentrations. Confirmatory sample locations are depicted on Figure 3. Soil laboratory analytical reports, quality assurance/quality control data, and chain-of-custody documentation are provided in Attachment 3.

As shown in Table 1, six confirmation soil samples and one sample duplicate had concentrations of TPH above the LUST Cleanup Goal of 100 mg/kg. All of the samples that exceeded the 100 mg/kg TPH Cleanup Goal were located on the walls of the excavation between one and three feet below grade. All of the bottom sample concentrations were less than 100 mg/kg and there was no discolored soil in the surface interval (0 to 6 inches depth).

5.2 RISC SAMPLE RESULTS AND EVALUATION

The soil samples that exceeded the 100 mg/kg TPH Cleanup Goal S-9, S-10, S-11 and S-19 at the north end of the excavation adjacent to a manhole, and S-22, S-23 and S-24 Duplicate at the south end and southwest corner of the excavation. The analysis for BTEX was performed by Method SW846-8260B (Purgeable aromatics by GC/MS) and PAHs by Method SW846-8270C (Semi-volatile organics (base/neutral fractions)) following sample preparation by SW846-3550A (GC/MS sonication extraction for organics).

Analytic results for the RISC compounds of concern BTEX and the PAHs are presented in Table 2. No BTEX compounds were detected in any of the samples. The analytical detection limits for the BTEX compounds (0.0050 mg/kg) are well below the RISC Default Residential Closure Levels for soil.

The ERO results for the respective samples are presented at the top of the Parameter section in each sample result column. As can be seen, a high ERO concentration does not always correspond to high PAH concentrations. Of the PAH concentrations reported, the benzo(a)-pyrene concentrations in S-19 and S-22, 1.6 and 2.2 mg/kg, respectively, exceed the RISC Default Commercial/Industrial Closure Level for surface soil of 1.5 mg/kg. Also, the reported detection limit for dibenzo(a,h)anthracene is S-22 exceeds the 1.5 mg/kg Default Commercial/ Industrial Closure Level for that compound for surface soils. These concentrations are indicated in boldface on Table 2. However, as noted in section 5.1, these samples were all collected below the surface soil depth interval of zero (0) to six (6) inches. The Default Closure Levels for benzo(a)pyrene and dibenzo(a,h)anthracene are based on direct contact. As the S-19 and S-22 samples were collected below the depth of twelve (12) inches, the Subsurface Soil Default Closure Levels of 16 mg/kg for benzo(a)pyrene and 60 mg/kg for dibenzo(a,h)anthracene are applicable.

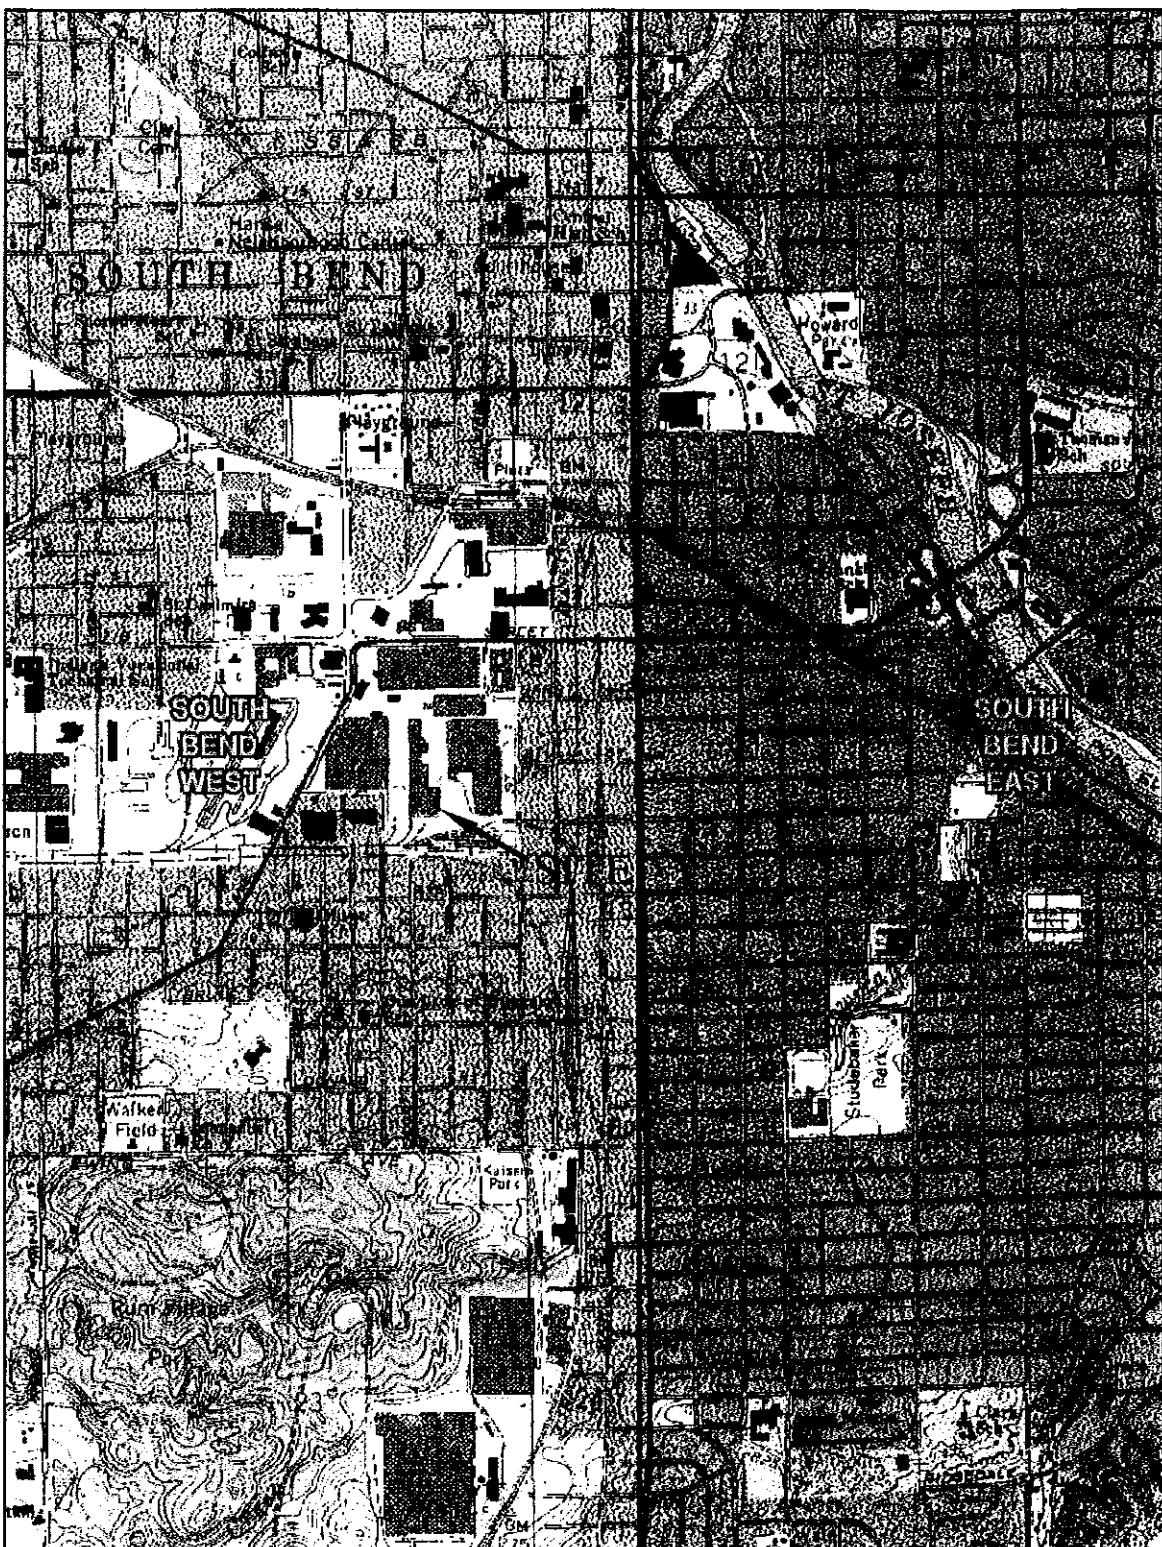

6.0 CONCLUSIONS AND RECOMMENDATIONS

All of the confirmation samples collected from the bottom of the Area A excavation met the IDEMs closure level of 100 mg/kg for TPH. Six (6) of the eleven (11) wall samples had TPH concentrations exceeding the 100 mg/kg TPH closure level. Subsequent analysis for the RISC TPH compounds of concern, BTEX and PAHs, met the RISC Default Commercial/ Industrial Closure Level for Subsurface Soil. As there is no threat of direct contact with the remaining TPH, KERAMIDA believes no further remedial action is necessary at Area A to protect human health and the environment in a Commercial/Industrial land use setting.

BTEX (mg/kg)		BDL		BDL		BDL		NA	NA

Notes:

BDL = Below detection limit of 0.0050 mg/kg

PAH = Polycyclic aromatic hydrocarbon

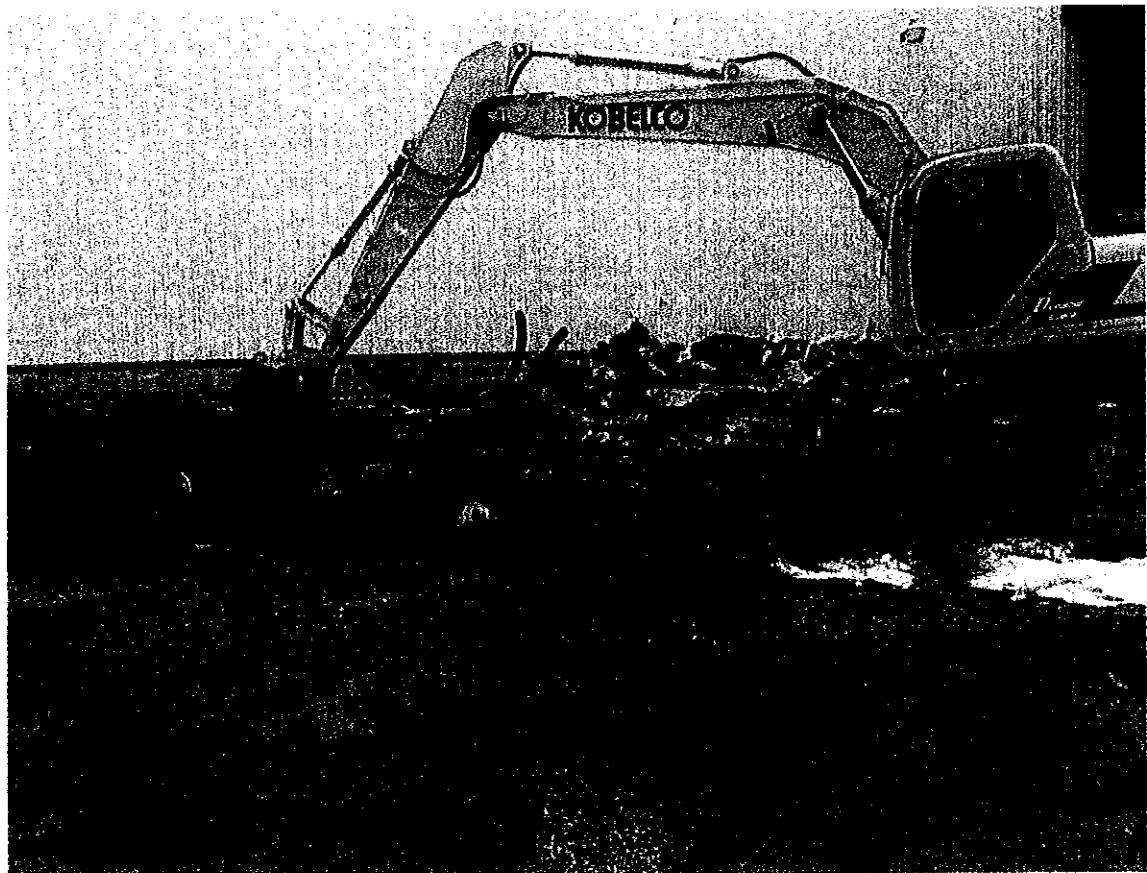

BTEX = Benzene, toluene, ethylbenzene, xylenes

NA = No BTEX compounds were detected at detection levels below RISC Residential Closure Levels. Therefore not applicable in this instance.

RISC = Risk Integrated System of Closure (Indiana Department of Environmental Management 1/1/04)

mg/kg = Milligram per kilogram

Bold = compound concentration that exceeds default RISC Commercial/Industrial Closure Level for surface soil. Compare to bold subsurface soil Closure Level.

This photograph is of the north end of the excavation. The manhole is located between the yellow and orange posts on the right in front of the excavator. The two pipes visible in the center of the photograph did not extend across the excavation and were not blanked off.

This photograph is of the north end of the excavation looking to the north. A third metal pipe has been located and bent back towards the building. The pipes did not contain product and were disposed with the soil. The excavator is currently exposing one of the three concrete monoliths encountered during the excavation activities.

This photograph was taken at the beginning of the excavation of the impacted soil near the center of Area A. Visible is discolored, petroleum impacted soil, one of the buried metal pipes in place, and the first of the concrete monoliths encountered in the excavation area. The view is looking toward the northeast.

The steel rails and ties of the rail spur are imbedded in the concrete. This view is looking northeast toward the north end of the excavation. One of the concrete monoliths is visible above the rail on the right. The petroleum impacted soil is dark gray and dark grayish brown.

Another view of the petroleum impacted soil. Note that the discolored material does not extend up to the base of the concrete, but that there is an approximately six (6) inches thick interval of soil between the concrete and discolored soil below.

This view is of the west wall of the excavation as impacted soil is being progressively removed to the foundation of Building 93 in the background. The impacted soil is the distinct dark grayish brown material exposed in the wall and bottom of the excavation.

Loading the impacted soil for transport to Prairie View RDF.

SHIPPING AND RECEIVING

The following samples were received at Heritage Environmental laboratory on February 14, 2005:

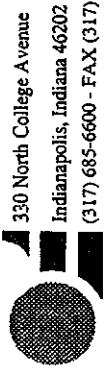

A689760 – A689785

The samples were received within EPA recommended holding times and in good condition. If required, a pH screen confirmed that the sample was preserved to acceptable pH levels. Samples were analyzed within holding times as prescribed by the analytical method. Exceptions to these statements, additional information, and any analytical anomalies are noted on the accompanying Certificates of Analysis Reports.
